## Description

Shoppit is social shopping app. Users add upload items to the app that anyone using the app can see.

Shoppit allows users to find products that are nearby, at good prices, using the power of crowdsourcing. It also allows users to share any interesting items they might come across that might not be available online.

The app makes uses of Parse.com as a backend. We made use of the zxing library to allow users to add items by barcode. Other technologies used in the app are GPS and google maps.
